Final Year B. Tech., Sem VII 2022-23

Cryptography And Network Security Lab

Assignment submission

PRN No: 2019BTECS00077

Full name: Avinash Vishnu Biradar

Batch: B7

Assignment: 13

Title of assignment: Implementation of SHA – 512 (Secured Hash Algorithm)

Title:

Implementation of SHA – 512 (Secured Hash Algorithm)

Aim:

To develop and implement the SHA – 512 (Secured Hash Algorithm)

Theory:

- SHA-2 (Secure Hash Algorithm 2) is a set of cryptographic hash functions designed by the United States National Security Agency (NSA) and first published in 2001.
- They are built using the Merkle–Damgård construction, from a one-way compression function itself built using the Davies–Meyer structure from a specialized block cipher.

- SHA-2 includes significant changes from its predecessor, SHA-1. The SHA-2 family consists of six hash functions with digests (hash values) that are 224, 256, 384 or 512 bits.
- SHA-512, or Secure Hash Algorithm 512, is a hashing algorithm used to convert text of any length into a fixed-size string. Each output produces a SHA-512 length of 512 bits (64 bytes). This algorithm is commonly used for email addresses hashing, password hashing, and digital record verification.

Implementation of SHA 512 (Secured Hash Algorithm)

Code:

```
#include<bits/stdc++.h>

#define ull unsigned long long

#define SHA_512_INPUT_REPRESENTATION_LENGTH 128
#define BLOCK_SIZE 1024

#define BUFFER_COUNT 8
#define WORD_LENGTH 64
#define ROUND_COUNT 80

using namespace std;
